1 Code Snippet Example

```
type Figure struct {
    Target string
    Path    string
    Caption interface{}
    Label   interface{}           // LaTeX only
    Options interface{}         // LaTeX only
    Place   interface{}         // LaTeX only
    Suffix  map[string]string    // not externally used
}

const latexTemplate = `
\begin{figure}[{{.Place}}]
\centering
\includegraphics[{{.Options | stringify}}]{%
    {{.Path}}.{{index .Suffix .Target}}{{.}}.}
\caption{{.Caption | stringify}}
\label{{"fig:"}}{{.Label | stringify}}
\end{figure}
`
```

2 amsthm Example

2.1 Circle

Definition 2.1 (Plane). In mathematics, a plane is a flat, two-dimensional surface that extends infinitely far.

Definition 2.2 (Circle). A circle is a shape consisting of all points in a plane that are a given distance from a given point, the centre; equivalently it is the curve traced out by a point that moves in a plane so that its distance from a given point is constant.

2.2 Chord and tangent line

Definition 2.3 (Chord). A line segment whose endpoints lie on the circle, thus dividing a circle in two segments.

Definition 2.4 (Tangent line). A tangent line to a circle is a line that touches the circle at exactly one point, never entering the circle's interior.

3 Figure Example

3.1 Tangent Line

See Figure 1, We have a theorem about tangent line to a circle:

Theorem 3.1 (Tangent line to a circle). A line is tangent to a circle if and only if the line is perpendicular to the radius drawn to the point of tangency.

Figure 1: Tangent line to a circle

3.2 Inscribed angle and central angle

Figure 2: Inscribed Angle and Central Angle
